25 **Abstract**

26 A new genus and species of monogenean belonging to the Gyrodactylidae, *Citharodactylus gagei* n.
27 gen. et n. sp. (Plathyhelminthes, Monogenea), is described from the gills of the moon fish,
28 *Citharinus citharus* (Geoffroy Saint-Hilaire), a characiform fish collected from Lake Turkana in
29 northern Kenya. The new viviparous genus can be readily distinguished from the six other
30 gyrodactylid genera recorded from Africa and from the other viviparous genera within the
31 Gyrodactylidae based on the morphology of the male copulatory organ (MCO), which consists of a
32 muscular ovate organ with an opening onto the tegument through which the narrow tapered end of a
33 sclerotised curved cone-shaped structure protrudes. The tegumental opening of the MCO is
34 surrounded by a collar of short spines. Sequencing of the nuclear ribosomal DNA internal
35 transcribed spacers 1 and 2, the 5.8S and the 18S rDNA genes and a comparison with the
36 gyrodactylid species listed in GenBank confirmed the specimens are unique and do not match with
37 any existing entry. When phylogenies for each genomic region were conducted (*i.e.* 0.064 gamma-
38 corrected pairwise genetic distance based on a alignment of 1750 bp of the 1857 bp long 18S rDNA
39 gene), the most similar match was that of *Afrogyrodactylus* sp. [= *A. girgiffae* Přikrylová et Luus-
40 Powell, 2014] from *Brycinus nurse* (Rüppell). The proposed name of the new parasite is
41 *Citharodactylus* n. gen. which represents the seventh gyrodactylid genus to be found in Africa and,
42 the 25th viviparous genus and the 32nd genus to be added to the Gyrodactylidae.

43

44 **Introduction**

45 Currently, there are six genera within the Gyrodactylidae described from African aquatic hosts,
46 namely *Afrogyrodactylus* Paperna, 1968; *Diplogyrodactylus* Přikrylová, Matějusová, Musilová,
47 Gelnar et Harris, 2009; *Gyrdicotylus* Vercammen-Grandjean, 1960; *Gyrodactylus* von Nordmann,
48 1832; *Macrogyrodactylus* Malmberg, 1957; and, *Mormyroggyrodactylus* Luus-Powell, Mashego et
49 Khalil, 2003 (see von Nordmann 1832; Vercammen-Grandjean 1960; Paperna 1968; Luus-Powell et
50 al. 2003; Přikrylová et al. 2009a). Of these, only *Gyrodactylus* is cosmopolitan, the remaining

51 genera are endemic to Africa. Of the African gyroductylids, those belonging to *Gyrodactylus* are the
52 most speciose with 33 species described to date (Table 1).

53 Characiformes are a highly diverse group of freshwater fish with nearly 2000 nominal
54 species distributed globally; they represent a significant proportion of the freshwater fish fauna
55 (Nelson 2006). The characiform fish fauna exhibits pronounced asymmetry in the distribution on
56 the two sides of the Atlantic Ocean. The greatest diversity of characiforms is found in the
57 Neotropics with 19 families and over 1700 species, while the African fauna is much poorer with
58 only four families, *i.e.* the Alestidae, Citharinidae, Distichontidae and Hepsetidae, and 232 species
59 (Nelson 2006; Van Der Laan et al. 2014). The Citharinidae is one of the less species-rich families in
60 Africa with only eight species belonging to three genera. Citharinids, commonly known as lutefish,
61 are distributed throughout much of tropical Africa, and constitute an important part of artisanal
62 fishing catches (Weitzman and Vari 1998). Such is the case of the moon fish, *Citharinus citharus*
63 (Geoffroy Saint-Hilaire), which is a commercially important species in several regions across
64 Africa, where it represents a significant source of dietary protein for the local people (Ezenwaji and
65 Ezenwaji 2009).

66 Although the number of fish monogeneans described from African hosts is increasing, only
67 a few species are recorded from *C. citharus*. Of these, the accounts focus on two species, *i.e.*
68 *Nanotrema citharini* Paperna, 1969 described from Ghanaian populations and, *Nanotrema*
69 *niokoloensis* Musilová, Řehulková et Gelnar, 2011 (see Paperna 1969; Khalil and Polling 1997;
70 Musilová et al. 2011) described from Senegal. In addition to these monogeneans, *C. citharus* is also
71 a host to several myxozoans, *i.e.* to species of *Thelohanellus* Kudo, 1933 and *Myxobolus* Bütschi,
72 1882 (see Fomena et al. 2004, 2007), to the nematodes *Cithariniella citharini* Khalil, 1967 and
73 *Procamallanus leaviconchus* (Wedl, 1862) Baylis, 1923, to the paramphistome *Brevicaecum*
74 *niloticum* McClelland, 1953, and to the acanthocephalan *Neoechinorhynchus africanus* Troncy,
75 1970 (see Khalil and Polling 1997).

76 The current study describes a new viviparous genus of gyrodactylid monogenean collected
77 from the gills of *C. citharus* from Lake Turkana, Kenya, which was first reported as *Gyrodactylus*
78 sp. 3 by Přikrylová et al. (2013) but never formally described. In the current study, both
79 morphological and molecular analyses are applied to provide a formal description of the new
80 species and the basis for erecting a new genus to accommodate it.

81

82 **Materials and methods**

83 ***Collection of host and parasite material***

84 From two sampling trips made in September 2008 and September 2010, a total of 34 specimens of
85 moon fish, *C. citharus* (mean total length 35.2 ± 5.9 cm; mean weight 608.3 ± 284.7 g), were
86 collected from three sites on Lake Turkana, namely Kalokol ($3^{\circ}33' 29.1''$ N, $35^{\circ} 54' 58.0''$ E; n = 8
87 specimens), Loiyangalani ($2^{\circ} 45' 43.18''$ N, $36^{\circ} 41' 58.49''$ E; n = 12), and Todonyang ($4^{\circ} 27'$
88 $03.53''$ N, $35^{\circ} 56' 37.08''$ E; n = 14). The fish were caught by local fishermen using seine nets and
89 then immediately transported live to a mobile laboratory for screening for parasites. Fish were
90 sacrificed by severing the spinal cord just posterior to the cranium. Monogeneans removed from the
91 gills were either prepared as whole mounts in ammonium picrate - glycerine (APG) (Malmberg
92 1970) or were fixed in absolute ethanol for subsequent molecular analyses. From the ethanol fixed
93 specimens, their posterior attachment organs were excised using a scalpel blade and then subjected
94 to proteolytic digestion as described in Paladini et al. (2009). The resultant hook preparations were
95 arrested by adding a drop of APG and then by permanently sealing the edges with Pertex (Histolab
96 Products AB, Gothenburg, Sweden) as applied in earlier studies (Rubio-Godoy et al. 2012). The
97 corresponding anterior body portion of each excised gyrodactylid specimen was used for molecular
98 characterisation. Prior to depositing the specimens in museum collections, the specimens in APG
99 were transferred into Canada balsam following the procedure proposed by Ergens (1969).

100

101 ***Morphological analysis***

102 Morphometric analyses of the collected material were conducted at the Laboratory of Parasitology,
103 Department of Botany and Zoology, Masaryk University, Brno, Czech Republic and also at the
104 Aquatic Parasitology Laboratory, Institute of Aquaculture, University of Stirling, Stirling, United
105 Kingdom. The sclerotised elements within the posterior attachment organ were measured using 26
106 point-to-point morphometrics variables as described by Shinn et al. (2004) and Paladini et al.
107 (2011). A phase-contrast microscope Olympus BH2 fitted with a JVC KY-F30B 3CCD video
108 camera and KS300 (ver.3.0) (Carl Zeiss Vision GmbH, 1997) image analysis software were used to
109 obtain values for the analysed features. Images of the attachment apparatus and key anatomical
110 features were captured using a Zeiss AxioCam MRc digital camera mounted on top of an Olympus
111 BX51 compound microscope and using MRGrab 1.0.0.4 (Carl Zeiss Vision GmbH, 2001) software.

112 Drawings of the parasites were made under an Olympus BX51 microscope fitted with a
113 *camera lucida*. All measurements presented in the current study are expressed in micrometres,
114 unless otherwise stated, as the mean \pm 1 standard deviation, followed by the range in parentheses.

116 ***Molecular analysis***

117 For molecular analysis, the ethanol fixative within each specimen tube was evaporated in a vacuum
118 centrifuge and then DNA from the parasite remaining in the tube was extracted using a DNeasy®
119 Blood & Tissue kit (Qiagen®) following the manufacturer's instructions. Amplification of the
120 internal transcribed spacer (ITS) region was conducted using primers ITS-1F (5'-
121 GTTTCGCTAGGTGAACCT-3') and ITS-2R (5'-TCCTCCGCTTAGTGATA-3') (Rokicka et al.
122 2007), while amplification of the 18S rDNA region was achieved by using a combination of the
123 primers SSU F (5'-GATCCTTCTGCAGGTTACCTAC-3') and SSU R (5'-
124 AAGCTGGTTGATCCTGCCAGT-3') (Cunningham et al. 1995) with 18S F-INT (5'-
125 CTATTGGAGGGCAAGTCTGG-3') and 18S R-INT (5'-CCGAACATCTAAGGCATCA-3')
126 (Přikrylová et al. 2013), following the protocol detailed in Přikrylová et al. (2013). The sequencing

127 and phylogenetic analyses that were conducted for the for the current study are detailed within
128 Přikrylová et al. (2013); the parasite material of interest in this altter study and re-evaluated here, is
129 referred to as “*Gyrodactylus* sp. 3”.

130

131 **Results**

132 Thirty-four wild moon fish were examined from the three sampling locations on Lake Turkana;
133 only two fish (*i.e.* 5.8%) collected at Kalokol were infected with gill monogeneans (n = 22). The
134 general morphology of the attachment apparatus and the presence of an embryo *in utero* indicated
135 that the viviparous monogeneans belong to the Gyrodactylidae; however, the structure of the male
136 copulatory organ (MCO) was unique among family members. Morphological and molecular
137 descriptions of the parasite are provided below.

138

139 **Class Monogenea Carus, 1863**

140 **Gyrodactylidae Cobbold, 1864**

141

142 ***Citharodactylus* n. gen. (Figs. 1 and 2; Table 2)**

143 Body fusiform. Anterior end characterised by single pair of cephalic lobes, each bearing a spike
144 sensillum and associated gland. Two excretory bladders present, in-line with the male copulatory
145 organ (MCO). Eye spots absent. Pharynx spherical, consisting of a posterior and anterior bulb, the
146 latter possessing two muscular rings surrounding a triangular mouth. Pharynx with eight short
147 pharyngeal processes. Oesophagus branching into two simple, blind-ended intestinal crura that
148 extend beyond the ovary. Viviparous, with up to two embryos *in utero*. MCO bulbous, ventrally
149 positioned, close to the bifurcation of the intestinal crura. Central tube of MCO marked by three
150 chambers of decreasing size, lying within a sclerotised, curved cone which tapers to a hollow tip
151 which protrudes through an opening onto the tegument; the tegumental opening is surrounded by
152 *ca.* 40 small, upwardly-facing, splinter-like spines. *Vesicula seminalis* located posterior to the

153 MCO. Vagina absent. Uterus positioned centrally, typically with at least an F1 embryo present.
154 Single testis positioned posterior to the uterus; posterior to this is a single ovary. Opisthaptor
155 delineated from the rest of the body, bearing a single pair of hamuli with a constriction between the
156 shaft and point regions on each hamulus. Ventral bar simple, without antero-lateral processes and
157 with a short, narrow, lingulate membrane. Dorsal bar thin, with prominent attachment points.
158 Sixteen marginal hooks equally distributed around the periphery of the opisthaptor, each bearing a
159 filament loop.

160

161 ***Citharodactylus gagei* n. sp. (Figs 1 and 2; Table 2)**

162 Twenty-two specimens were used for the morphological study. Complete morphometric
163 measurements of the body structures and opisthaptoral attachment structures are presented in Table
164 2. Body elongated, 616 (412–726) long, 90 (67–125) wide at the level of the uterus. Pharynx
165 muscular bulb 33.8 (28.8–39.3) long and 30.8 (25.6–36.5) wide; anterior bulb of pharynx consisting
166 of two thick muscular rings, with eight, short pharyngeal processes. Oesophagus short, branching
167 into two intestinal caeca that pass down each side of the body and extend past the ovary. Excretory
168 bladders present. MCO observed in 11 specimens; MCO bulb-shaped 23.5 (22.1–24.6) long \times 20.1
169 (19.2–21.9) wide; positioned ventrally between the posterior pharyngeal bulb and the anterior part
170 of the uterus; consisting of a principal conical spine originating from the centre of the bulb,
171 surrounded by a series of *ca.* 40 small spines, 1–2 long and terminating as a tubular duct-like spine.
172 There is a single testis; posterior to this is the ovary. Hamuli with long roots, 32.7 (28.1–35.1) long;
173 with a thickened dorsal edge that tapers away from the dorsal bar attachment point to the apex of
174 the root. Hamulus total length 66.8 (64.5–69.6); shaft 46.5 (43.4–49.1) long; point 26.3 (24.3–29.0)
175 long and marked by a constriction between point and shaft regions. Ventral bar median portion
176 thick, 6.5 (5.4–7.3) long, with no antero-lateral processes and with a narrow lingulate membrane,
177 6.7 (6.0–8.2) long. Dorsal bar simple, thin, 19.0 (14.7–23.8) long, with attachment points on
178 hamuli, 8.9 (8.4–9.7) long. Sixteen marginal hooks of similar morphology, 30.7 (29.2–32.1) long.

179 Marginal hook sickle proper 5.1 (4.6–5.6) long, bearing filament loop approximately one sixth the
180 length of the entire marginal hook structure. Sickle proper has: a narrow base with a flat underside;
181 a narrow toe; a small additional curve on the inner face of the sickle between the base and shaft
182 regions; a slightly forward projecting shaft region; a gracile sickle tip that projects slightly
183 downwards and that terminates at a point beyond the limit of the toe; and, a narrow heel, that curves
184 gently and extends approximately one third of the way up the length of the sickle proper.

185

186 ***Taxonomic summary***

187 *Type and only species: Citharodactylus gagei* n. sp. (referred to as “*Gyrodactylus* sp. 3” *sensu*
188 Příkrylová et al. 2013).

189 *Type host:* Moon fish *Citharinus citharus* (Geoffroy Saint-Hilaire) (Characiformes: Citharinidae),
190 wild.

191 *Site on the host:* Gills.

192 *Type locality:* Lake Turkana, Kalokol, Ferguson’s Gulf (3°33’33.56” N; 35°54’48.85” E).

193 *Environmental conditions under which specimens were collected:* Salinity and temperature, 2.5‰
194 and 27°C, respectively.

195 *Type material:* Holotype and three paratypes (acc. no. M-592) are deposited in the
196 Helminthological Collection held at the Institute of Parasitology, Academy of Sciences of the Czech
197 Republic, České Budějovice. A further two specimens (acc. nos. 2015.3.20.12-13) are deposited in
198 the parasite collection of the Parasites and Vectors Section, The Natural History Museum (NHM),
199 London, United Kingdom, and two additional specimens (acc. nos. M.T. 37789-90) are deposited in
200 the parasite collection of the Royal Museum for Central Africa, Tervuren, Belgium.

201 *Molecular sequence data:* The 2536 bp ribosomal DNA sequence covering the 18S rDNA gene
202 (1857 bp), ITS1 (295 bp), 5.8S gene (157 bp) and ITS2 (227 bp) is deposited in GenBank under
203 accession numbers HF548669 (partial ITS region) and HF548670 (18S region).

204 *General:* Details of this species have been submitted to ZooBank (International Commission on
205 Zoological Nomenclature (ICZN) 2012) with the Life Science Identifier (LSID) [zoobank.org/pub:](https://zoobank.org/pub:7906DB59-27C5-4870-B961-261A4793AE74)
206 7906DB59-27C5-4870-B961-261A4793AE74.

207 *Etymology:* The genus is named after the Latin name of the fish from which this parasite was
208 recorded. The species is named after the local Turkana name of the host, *i.e.* “*gage*”.

209

210 ***Differential diagnosis***

211 *Citharodactylus* n. gen. can be differentiated from the other 25 viviparous genera within the
212 Gyrodactylidae on the basis of the MCO (see Table 3). Species belonging to *Afrogyrodactylus* and
213 *Diplogyrodactylus* possess elongated MCOs, however, neither are spined nor have outer spinous
214 reinforcements (see Table 3). *Mormyrogryrodactylus* also has a muscular, tubular MCO bearing
215 spines, however, the configuration of these are quite different to that of *C. gagei* n. sp. which
216 possesses a sclerotised cone-shaped structure within the main MCO bulb. The hamuli of *C. gagei* n.
217 sp. have a distinctive constriction at the junction between the point and shaft regions (Figs. 1a, 2c).
218 This feature, however, is not restricted to the new genus described here; similar constrictions have
219 been observed on the hamuli of *Afrogyrodactylus* sp. presented in Přikrylová and Luus-Powell
220 (2014) and in Paperna’s drawings (1968), however, the hamuli of *Afrogyrodactylus* differ in that
221 they have well-developed outer roots. Similar constrictions are seen on the hamuli of *Gyrodactylus*
222 *nyongensis* Nack, Bilong Bilong *et* Euzet, 2005, but this species can be readily discriminated from
223 *C. gagei* n. sp. by: the shape and arrangement of the MCO; by the larger size of the hamuli (64.5–
224 69.6 for *C. gagei* n. sp. vs 150–166 for *G. nyongensis*); by a long, filamentous ventral bar
225 membrane; and, by the morphology of their marginal hook sickles. *Gyrodactylus nyongensis* have
226 short marginal hook shafts (Nack *et al.* 2005), which are, proportionally, about the half of the total
227 length of the marginal hooks, whereas the specimens of *C. gagei* n. sp. have long shafts with
228 marginal hook sickles that are only about 1/6 of the total length.

229

230 ***Molecular characterisation***

231 The PCR amplification of the two nuclear regions (ITS and 18S) from the three specimens of *C.*
232 *gagei* n. sp. resulted in identical sequence lengths of 679 (ITS1 + 5.8S + ITS2) and 1,857 bp (18S)
233 respectively. From the phylogenetic analyses that was conducted and detailed in Přikrylová et al.
234 (2013), *Afrogyrodactylus* sp. (= *A. girgifae* Přikrylová et Luus-Powell, 2014 collected from
235 *Brycinus nurse* (Rüppell)) emerged as a sister taxon to *Citharodactylus* n. gen. (*i.e.* *Gyrodactylus*
236 sp. 3 in Přikrylová et al. 2013). Here, the two genera differed by 112 bp (6%) across 1,860 bp used
237 for the alignment (0.064 gamma-corrected pairwise genetic distance under GTR + C + I model)
238 (Přikrylová et al. 2013). When the ITS sequences of both genera were aligned and compared using
239 MEGA6 (Tamura et al. 2013) they differed by 200 bp (28.5%) across the 701 bp alignment with
240 transitions and transversions included.

241

242 **Discussion**

243 *Citharodactylus gagei* n. gen. et n. sp. is a viviparous gyrodactylid with unique morphology,
244 supported by molecular analyses, and possesses a MCO that differs from the six other genera
245 described from Africa and from the other 31 genera within the Gyrodactylidae (Fig. 2e, Table 3).
246 The molecular analyses conducted by Přikrylová et al. (2013), which included species
247 representatives from ten gyrodactylid genera, confirmed the placement of *C. gagei* n. sp. (= *Gyrodactylus*
248 sp. 3 *sensu* Přikrylová et al. 2013) within the Gyrodactylidae as a sister taxon to the
249 genus *Afrogyrodactylus*.

250 Although the molecular analyses placed *Citharodactylus* n. gen. as a sister taxon to
251 *Afrogyrodactylus* the MCOs of both genera differ; those of *Afrogyrodactylus* species are typically
252 unarmed, elongated, muscular pouches, while that of *C. gagei* n. sp. has a sclerotised cone-shaped
253 structure housed within a muscular bulb, which is armed with a field of small spines around its
254 opening onto the tegument. Whether the MCO of *Citharodactylus* n. gen. also resembles that of

255 *Gyreteroncus* Euzet *et* Birgi, 1988, requires further investigation. Four species, three of which a
256 name was ascribed to, were assigned to this genus by Euzet and Birgi (1988) in a conference
257 abstract, however, these were never officially described and the genus is not valid and is
258 considered a *nomen nudum*. The three “named” species in the abstract, *i.e.* *Gyreteroncus brienomyri*
259 from *Brienomyrus niger* (Günther) and *G. caboti* and *G. chariensis* from *Marcusiensis cyprinoides*
260 (L.), were said to possess an MCO “armed with numerous small spines”. The fourth and unnamed
261 species collected from *Polypterus senegalus* Cuvier, however, possesses an MCO without spines
262 (see Fig. 3c in Přikrylová *et al.* 2009a). This observation was confirmed through the subsequent
263 examination of *Gyreteroncus* sp. specimens collected from *P. senegalus* from Senegal. This species
264 was subsequently transferred to a new genus erected by Přikrylová *et al.* (2009a) as
265 *Diplogyrodactylus martini* Přikrylová, Matějusková, Musilová, Gelnar *et* Harris, 2009. The
266 unpublished research notes linked to the conference abstract of Euzet and Birgi (1988) include
267 sketches of the opisthaptoral armature of all four *Gyreteroncus* species, most notable are the
268 marginal hooks which are of different sizes and sickle morphologies; this feature alone permits their
269 ready discrimination from *C. gagei* n. sp.

270 A tubular armed MCO can be seen in egg-laying gyroductylid genera, such as
271 *Phanerothecium* Kritsky *et* Thatcher, 1977, and *Hyperopletes* Boeger, Kritsky *et* Belmont-Jégu,
272 1994 (see Kritsky and Thatcher 1977; Kritsky and Boeger 1991; Boeger *et al.* 1994; Bakke *et al.*
273 2007). In the other viviparous genera of Gyrodactylidae recorded from Africa, both tubular armed
274 and non-armed MCOs can be found, such as in *Diplogyrodactylus* (see Přikrylová *et al.* 2009a),
275 *Mormyrogyrodactylus* (see Luus-Powell *et al.* 2003) and in some undescribed *Gyrdicotylus*
276 Vercammen-Grandjean, 1960 species (Prof. P.D. Harris, personal communication). Features of the
277 MCO of each genera belonging to the Gyrodactylidae are summarised in Table 3.

278 The phylogenetic study of Přikrylová *et al.* (2013), based on two nuclear regions sequences,
279 determined the relationship of *Citharodactylus* n. gen. (presented as *Gyrodactylus* sp. 3) to ten other
280 genera within the Gyrodactylidae. Separate analyses of both ITS and 18S rDNA placed

281 *Citharodactylus* n. gen. as a sister taxon to *Afrogyrodactylus*. Both *Afrogyrodactylus* and
282 *Citharodactylus* n. gen. infect characiform fishes, specifically alestid and citharinid hosts,
283 respectively. The exact phylogenetic position of this cluster within the Gyrodactylidae, however,
284 would require a larger analysis with the inclusion of representatives from all taxa within the
285 Gyrodactylidae (see Table 3).

286 In the phylogenetic hypothesis, two of the African characiform families, the Citharinidae
287 and the Distichodontidae, form a sister group to all other characiforms (Ortí and Meyer 1997),
288 while the Alestidae and the Hepsetidae appear to fit among the Neotropical families studied so far;
289 this is supported by morphological and molecular data (Ortí and Meyer 1997; Buckup 1998;
290 Calcagnotto et al. 2005). The study of Oliveira et al. (2011), however, proposes a more basal
291 position for these latter two families.

292 Apart for the pronounced asymmetry in the distribution of characiform fish fauna on both
293 sides of the Atlantic Ocean, there is also a disproportionate distribution of the African characiforms,
294 with *ca.* 95% of species belonging to the Alestidae and the Distichodontidae (*i.e.* 219 species),
295 while the remaining 13 species belong to the Citharinidae and to the Hepsetidae (Nelson 2006). As
296 characiform fish play an important role in African fisheries and ornamental communities, there is
297 much interest in researching their health status. Current knowledge regarding their parasite fauna,
298 however, is still limited with regards to their overall diversity on the continent.

299 Of the species within the Alestidae and Distichodontidae, the parasite fauna of 26 species
300 has been investigated; while only four belonging to the Citharinidae and Hepsetidae have been
301 studied (Khalil and Polling 1997). Alestid fish in Africa are parasitised by several monogenean
302 genera including a variety of oviparous (*e.g.* *Annulotrema* von Nordmann, 1832, *Characidotrema*
303 Paperna *et* Thurston, 1969 and *Afrocleidodiscus* Paperna, 1969) and viviparous (*e.g.* *Gyrodactylus*
304 von Nordmann, 1832 and *Afrogyrodactylus* Paperna, 1968) species (Paperna 1968; Paperna and
305 Thurston 1969; Thurston 1970; Ergens 1973a; Molnár and Mossalam 1985; Euzet and Birgi 1988).
306 The only monogenean genus that has been described from citharinids is *Nanotrema*, which includes

three species parasitising *C. citharus* (see Paperna 1969; Khalil and Polling 1997; Musilová et al. 2011). The current knowledge of parasites from characiform fish is still very limited, however, the description of another new viviparous gyrodactylid genus, such as *Citharodactylus* n. gen., suggests that parasite diversity on African fish is still highly unexplored.

Acknowledgements

The authors gratefully acknowledge the research grant from the Czech Science Foundation awarded to IP (project no. GBP505/12/G112), and The Royal Society research grant awarded to GP (project no. RG150640), which both partially supported the current study. The authors would also like to thank Professor Milan Gelnar (MU, Brno) for granting access to the facilities within Masaryk University enabling aspects of the morphological and molecular analyses to be conducted.

<i>Mormyrogyrodactylus</i>			
<i>M. gemini</i>	<i>Marcusenius macrolepidotus</i>	Nwanedi-Luphephe Dams, South Africa	Luus-Powell et al. 2003

Footnotes: ¹ *Nomen nudum* according to Harris et al. (2004); ² Regarded as a junior synonym of *G. rysavyi* Ergens, 1973 in Paperna (1979); ³ This host is given as *Epiplatys fasciatus* in Paperna (1968), however, Fishbase (Froese and Pauly 2015) has no listing of this species as a valid species or as a synonym within its database. Fishbase, however, does list numerous species of which “*fasciatus*” forms part of the species root, therefore to avoid the propagation of misinformation, only the genus is referred to in the current study; ⁴ No further details are given in Paperna (1968, 1979).

Table 2. Morphological measurements (mean \pm 1 standard deviation followed by the range in parentheses) of *Citharodactylus gagei* n. gen. et n. sp. from *Citharinus citharus* (Geoffroy Saint-Hilaire) collected from Lake Turkana, Kenya. Measurements are provided in micrometres and follow those detailed in Shinn et al. (2004) and Paladini et al. (2011).

Variable	<i>Citharodactylus gagei</i> n. gen. et n. sp. (n = 22)
Total body length	616 \pm 90.0 (412–726)
Total body width	90 \pm 15.2 (67–125)
Total pharynx bulb length \times width	33.8 \pm 3.4 (28.8–39.3) \times 30.8 \pm 3.8 (25.6–36.5)
MCO bulb length \times width	23.5 \pm 0.8 (22.1–24.6) \times 20.1 \pm 0.9 (19.2–21.9)
Hamulus (H)	
H aperture	35.5 \pm 0.9 (34.2–36.9)
H proximal shaft width	10.4 \pm 1.2 (8.8–12.1)
H point length	26.3 \pm 1.2 (24.3–29)
H distal shaft width	5.0 \pm 0.3 (4.7–5.5)
H shaft length	46.5 \pm 1.7 (43.4–49.1)
H inner curve length	5.7 \pm 0.7 (5.1–6.7)
H aperture angle ($^{\circ}$)	61.3 \pm 0.7 (60.5–62.3)
H point curve angle ($^{\circ}$)	24.3 \pm 2.9 (21.1–27.7)
Inner H aperture angle ($^{\circ}$)	70.0 \pm 1.3 (68.2–71.4)
H root length	32.7 \pm 1.6 (28.1–35.1)
H total length	66.8 \pm 1.3 (64.5–69.6)
Dorsal bar (DB)	
DB total length	19.0 \pm 2.5 (14.7–23.8)
DB width	1.5 \pm 0.3 (1.0–2.1)
DB attachment point length	8.9 \pm 0.6 (8.4–9.7)
Ventral bar (VB)	
VB total width	19.3 \pm 1.0 (17.8–22.2)
VB total length	14.2 \pm 2.1 (11.9–16.5)
VB process-to-mid length	2.2 \pm 0.3 (1.9–2.7)
VB process length	n.a.
VB median length	6.5 \pm 0.7 (5.4–7.3)
VB membrane length	6.7 \pm 0.8 (6.0–8.2)
Marginal hook (MH)	
MH total length	30.7 \pm 0.8 (29.2–32.1)
MH shaft length	25.2 \pm 1.0 (22.5–26.5)
MH sickle length	5.1 \pm 0.2 (4.6–5.6)
MH sickle proximal width	3.8 \pm 0.2 (3.5–4.3)
MH toe length	2.2 \pm 0.2 (1.9–2.2)
MH sickle distal width	3.4 \pm 0.2 (3.0–3.8)
MH aperture	4.9 \pm 0.3 (4.5–5.8)
MH instep/arch height	0.2 \pm 0.1 (0.1–0.2)

Footnotes: n.a. = not available in that this species does not possess ventral bar processes.

Table 3. An annotated list of the 32 valid and 4 non-valid genera within the Gyrodactylidae Van Beneden *et* Hesse, 1863 providing brief details on the mode of reproduction, features regarding the male copulatory organ (MCO) and the armature of the attachment apparatus. Genera marked with an asterisk are found in Africa.

Genus	Validity	Mode of reproduction	MCO	MCO armature	Marginal hooks type	Hamulus roots	Accessory opisthaptoral sclerites present	Reference
<i>Acanthoplacatus</i>	Yes	Viviparous	Muscular non-eversible bulb	One apical spine + row of small spines	One	Single	No	Ernst et al. 2001
<i>Accessorius</i>	Yes	Viviparous	Bulbous	One apical spine + row of small spines	One	Single	Yes	Jara et al. 1991
<i>Afrogyrodactylus</i>	Yes	Viviparous	Muscular pouch	Spines absent	One	Inner and outer	No	Paperna 1968*
<i>Aglaiogyrodactylus</i>	Yes	Oviparous	Tubular copulatory organ sclerotised or not	Accessory piece comprised of one or more diverging branches associated with walls of copulatory sac	One	Inner and outer	No	Kritsky et al. 2007
<i>Anacanthocotyle</i>	Yes	Viviparous	Bulbous	One apical spine + row of small spines	One	No hamuli present	No	Kritsky and Fritts 1970
<i>Archigyrodactylus</i>	Yes	Viviparous	Bulbous	One apical spine + row of small spines	One	Inner and outer	Yes	Mizelle and Kritsky 1967
<i>Citharodactylus</i> n. gen.*	Yes	Viviparous	Muscular bulb with central sclerotised curved cone	Armed with numerous small spines	One	Single	No	present study
<i>Diechodactylus</i>	Yes	Viviparous	Bulbous	One apical spine + row of small spines	One	Single	Yes	Vianna et al. 2008
<i>Diplogyrodactylus</i>	Yes	Viviparous	Tubular	Spines absent	Two	Single	No	Přikrylová et al. 2009a*
<i>Fundulotrema</i>	Yes	Viviparous	Bulbous	One apical spine + row of small spines	One	Single	Yes	Kritsky and Thatcher 1977
<i>Gyrdicotylus</i>	Yes	Viviparous	Bulbous	Armed with a crown of 16-18 spines	One	Inner and outer	No	Vercammen-Grandjean 1960*

<i>Gyreteroncus</i>	Not valid	Viviparous	Not specified	Both armed (numerous small spines) and unarmed species	Three	Single	No	Euzet and Birgi 1988; Příkrylová et al. 2009a
<i>Gyrodactyloides</i>	Yes	Viviparous	Bulbous	One large apical spine and a row of smaller spines	One	Inner and outer	Yes	Bychowsky 1947
<i>Gyrodactylus</i>	Yes	Viviparous	Bulbous	One apical spine + row of small spines	Principally one	Single	No	von Nordmann 1832*
<i>Hyperopletes</i>	Yes	Oviparous	Pyriiform	Two regions of numerous small rectangular spines	One	Inner and outer	No	Boeger et al. 1994
<i>Ieredactylus</i>	Yes	Viviparous	Bulbous	One large apical spine + row of smaller spines	Two	Single	Yes	Schelkle et al. 2011
<i>Isancistrum</i>	Yes	Viviparous	Bulbous	One apical spine + row of small spines	One	No hamuli present	No	de Beauchamp 1912
<i>Laminiscus</i>	Yes	Viviparous	Bulbous	One large apical spine + row of smaller spines	One	Inner and outer	Yes	Pálsson and Beverley-Burton 1983
<i>Macrogyrodactylus</i>	Yes	Viviparous	Bulbous	One apical spine + row of small spines	Two	Single	Yes	Malmberg 1957*
<i>Metagyrodactylus</i>	Yes	Viviparous	Eversible bulb	One apical spine + row of small spines	One?	Single	No	Yamaguti 1963
<i>Micropolyclithrum</i>	Questionable validity	Viviparous	Bulbous	Single spine	Not presented	Single	Yes	Skinner 1975
<i>Mormyroggyrodactylus</i>	Yes	Viviparous	Elongated muscular pouch	One long central spine + several spinelets	One	Single	Yes	Luus-Powell et al. 2003*
<i>Neogyrodactylus</i> Baugh, 1957 (syn. of <i>Metagyrodactylus</i>)	Not valid							Baugh 1957; Yamaguti 1963

<i>Neogyrodactylus</i> Prudhoe, 1957 (syn. of <i>Macrogyrodactylus</i>)	Not valid							Malmberg 1957; Prudhoe 1957
<i>Nothogyrodactylus</i>	Yes	Oviparous	Eversible cirrus	Accessory copulatory sclerites present	One	Single	No	Kritsky and Boeger 1991
<i>Oogyrodactylus</i>	Yes	Oviparous	Extrusible penis	Tip has ring of sclerotised tissue	One	Inner and outer	No	Harris 1983
<i>Onychogyrodactylus</i>	Yes	Oviparous	Variably coiled, eversible	Spine-like accessory sclerite	One	Inner and outer	No	Kritsky et al. 2007
<i>Paragyrodactyloides</i> Nunez, 1975 (syn. of <i>Gyrodactylus</i>)	Not valid							Nuñez 1975; Popazoglo and Boeger 2000
<i>Paragyrodactylus</i>	Valid	Viviparous	Bulbous	One apical spine + row of small spines	One	Single	Yes	Gvosdev and Martechov 1953
<i>Paragyrodactylus</i> Szidat, 1973 (syn. of <i>Gyrodactylus</i>)	Not valid							Szidat 1973; Popazoglo and Boeger 2000
<i>Phanerothecioides</i>	Yes	Oviparous	Variably coiled, eversible	Spines absent	One	Inner and outer	No	Kritsky et al. 2007
<i>Phanerothecium</i>	Yes	Oviparous	Eversible bulb which may be sclerotised	Numerous small spines	One	Inner and outer	No	Kritsky and Thatcher 1977
<i>Polyclithrum</i>	Yes	Viviparous	Bulbous	One apical spine + row of small spines	One	Inner and outer	Yes	Rogers 1967
<i>Scleroductus</i>	Yes	Viviparous	Bulbous	One large apical spine + row of smaller spines	One	Single	No	Jara and Cone 1989
<i>Scutalatus</i>	Yes	Viviparous	Bulbous	One apical spine + row of small spines	One	Single	Yes	Vianna et al. 2007

<i>Swingleus</i>	Yes	Viviparous	Bulbous	One apical spine + row of small spines	One	Single	Yes	Rogers 1969

Fig. 1. Light micrographs of *Citharodactylus gagei* n. gen. *et* n. sp. from *Citharinus citharus* (Geoffroy Saint-Hilaire) collected from Lake Turkana, Kenya. a – opisthaptoral central hook complex showing the hamuli, the dorsal and the ventral bar (ventral view - with folded membrane); b – marginal hook; c– marginal hook sickle; d – ventral bar. Scale bars: a-c = 5 μ m; d = 3 μ m.

Fig. 2. Line drawings of *Citharodactylus gagei* n. gen. et n. sp. from *Citharinus citharus* (Geoffroy Saint-Hilaire) collected from Lake Turkana, Kenya. a – composition of whole parasite; b – pharynx; c - opisthaptor central hook complex; d – marginal hook; e - male copulatory organ. Scale bars: a = 50 μm ; b-e = 10 μm .
